

3D SHAPES

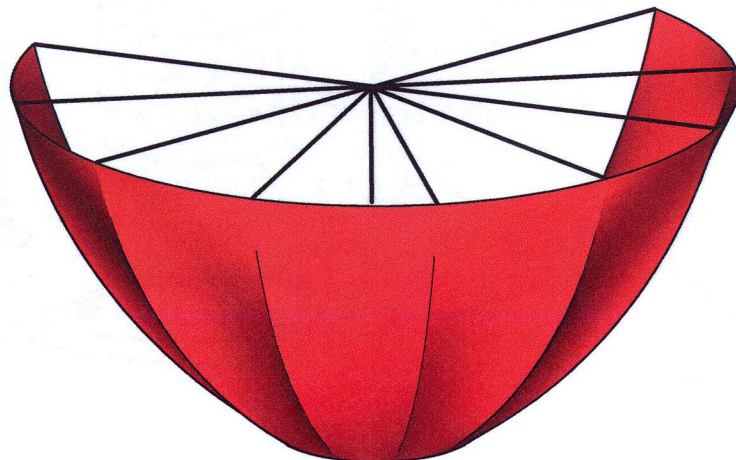

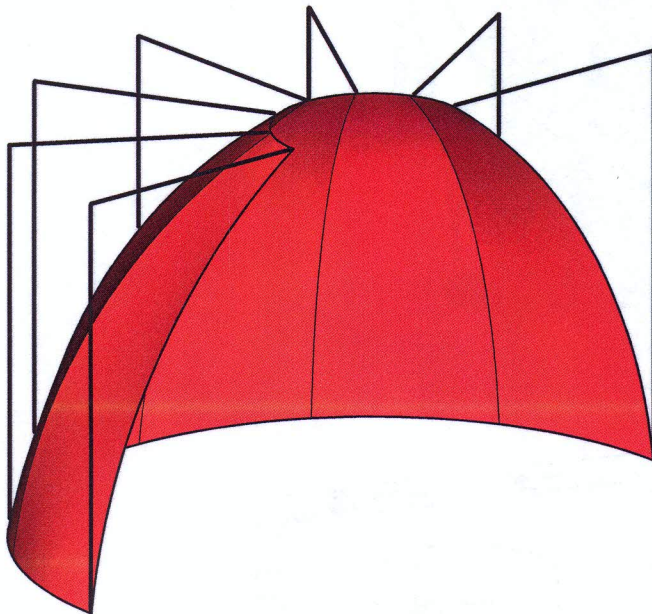

With EXTENZO® Stretch Ceilings the most complex architectural shapes can be achieved rapidly with few constraints.

The range of notched rails can be adapted to all curves in all directions; the flexibility of the profiles enables constant or variable curves to be followed; the arches are made on-site without special tools.

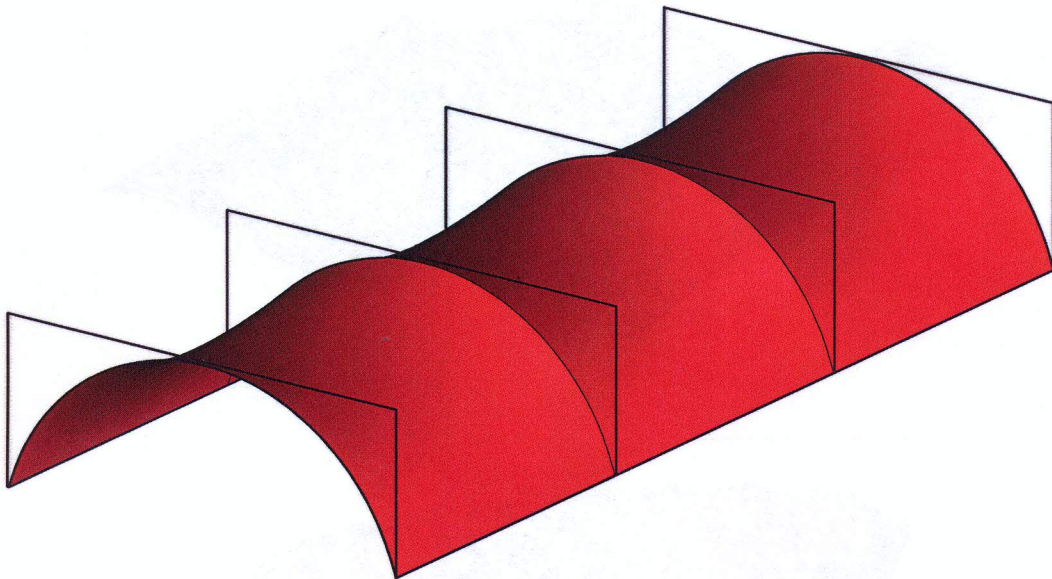

The separators are used to divide large pieces into basic shapes simpler and quicker to implement.

The guide rails are used to create panels, or localized deformations in the ceiling.
